

Exposé: Sydney Light Rail Gets the Heavy Duty EJ Cover-up

ERMATIC™ covers and frames - an easy decision for specifiers.

One of the key components of any light rail system – any rail system for that matter – is the necessity for a complex electrical network. With Sydney well and truly in the upheaval of an extension of the existing light rail network into the George Street/Circular Quay precinct, precision solutions to every aspect of construction is a must.

Which is why EJ has been commandeered for electrical network covers throughout the entire project. The choice made by the contractors was a wise one: quality, heavy duty, easy access covers and of course, ERMATIC™ covers from EJ ticked all of these boxes.

The spec was for paver infill 3-part covers and frames (Class D) with a deep pan to allow the standard Sydney Greystone pavers to slot into the cover with a minimum of stone

masonry expense. The ERMATIC™ covers were cast in the Picardie Foundry in France and assembled to the desired 3-part configuration prior to shipping direct into Sydney.

As exposés go, the specification of ERMATIC™ covers was probably no surprise to an engineer or construction company. The ease with which these covers can be installed and later accessed for servicing work makes it a no brainer to specify. And the EJ team will always make projects of this nature a breeze for those who need advice on best product solutions.
